This account of Darwin's life and work also sketches the prevailing climate of scientific opinion when he began his researches. Every aspect of Darwin's work, including his contributions to geology and botany, is examined.

This is Charles Darwin's chronicle of his five-year journey, beginning in 1831, around the world as a naturalist on the H.M.S. Beagle.

In a book that is both groundbreaking and accessible, Daniel C. Dennett, whom Chet Raymo of The Boston Globe calls "one of the most provocative thinkers on the planet," focuses his unerringly logical mind on the theory of natural selection, showing how Darwin's great idea transforms and illuminates our traditional view of humanity's place in the universe. Dennett vividly describes the theory itself and then extends Darwin's vision with impeccable arguments to their often surprising conclusions, challenging the views of some of the most famous scientists of our day.

An ethologist shows man to be a gene machine whose world is one of savage competition and deceit

Reveals how Darwin's study of fossils shaped his scientific thinking and led to his development of the theory of evolution. Darwin's Fossils is an accessible account of Darwin's pioneering work on fossils, his adventures in South America, and his relationship with the scientific establishment. While Darwin's research on Galápagos finches is celebrated, his work on fossils is less well known. Yet he was the first to collect the remains of giant extinct South American mammals; he worked out how coral reefs and atolls formed; he excavated and explained marine fossils high in the Andes; and he discovered a fossil forest that now bears his name. All of this research was fundamental in leading Darwin to develop his revolutionary theory of evolution. This richly illustrated book brings Darwin's fossils, many of which survive in museums and institutions around the world, together for the first time. Including new photography of many of the fossils--which in recent years have enjoyed a surge of scientific interest--as well as superb line drawings produced in the nineteenth century and newly commissioned artists' reconstructions of the extinct animals as they are understood today, Darwin's Fossils reveals how Darwin's discoveries played a crucial role in the development of his groundbreaking ideas.

Darwin's notebooks provide an invaluable record of his scientific thinking and most importantly, the development of his theory of natural selection. This edition of the notebooks, prepared to the highest standard of textual editing, thus affords a unified view of Darwin's professional interests. The Red Notebook, used on the voyage of H. M. S. Beagle and afterwards in England, contains Darwin's first evolutionary statements. In July of 1837, Darwin began his "Transmutation Notebooks" (B - E) devoted to the solution of the species problem and in the third notebook of this series he first formulated the theory of natural selection. This volume also contains Notebook A and the glen Roy Notebook on geology, Notebooks M and N on man and behaviour and a notebook labelled Questions and Experiments. Fresh transcriptions have been done for all previously published manuscripts, with readings made directly from Notebooks B, C, D and E, presenting them with previously excised pages and restored to their original sequence.

Jonah Ranger was restoring an antique 1955 Chevy when he heard a woman's voice on the car radio pleading for help. She said her name was Alice Davenport, and a man was holding her captive, forcing her into a grueling workout routine so she'd be a proper challenge when he hunted her like big game on his private estate.As they talked, her voice shifted from the radio to inside Jonah's head. Born with telepathic abilities, he'd helped Decorah Security rescue kidnap victims, but never had he felt this personal connection to one of them. Calling on psychic resources he didn't know he possessed, Jonah was able to project himself to Alice's location, where he could hold her in his arms, touch her, kiss her, and plan.
