Based on the results of a third survey, the engineering and programming characteristics of 222 different electronic digital computing systems are given. The data are presented from the point of view of application, numerical and arithmetic characteristics, input, output and storage systems, construction and checking features, power, space, weight, and site preparation and personnel requirements, production records, cost and rental rates, sale and lease policy, reliability, operating experience, and time availability, engineering modifications and improvements and other related topics. In this book the authors identify the basic concepts and recentadvances in the acquisition, perception, coding and rendering ofcolor. The fundamental aspects related to the science ofcolorimetry in relation to physiology (the human visual system) areaddressed, as are constancy and color appearance. It also addressesthe more technical aspects related to sensors and the colormanagement screen. Particular attention is paid to the notion ofcolor rendering in computer graphics. Beyond color, the authorsalso look at coding, compression, protection and quality of colorimages and videos.
