For four decades, information theory has been viewed almost exclusively as a

theory based upon the Shannon measure of uncertainty and information, usually referred to as Shannon entropy. Since the publication of Shannon's seminal paper in 1948, the theory has grown extremely rapidly and has been applied with varied success in almost all areas of

human endeavor. At this time, the Shannon information theory is a well established and developed body of knowledge. Among its most significant recent contributions have been the use of the complementary principles of minimum and maximum entropy in dealing with a

variety of fundamental systems problems such as predictive systems modelling, pattern recognition, image reconstruction, and the like. Since its inception in 1948, the Shannon theory has been viewed as a restricted information theory. It has often been argued that the theory is capable of

dealing only with syntactic aspects of information, but not with its semantic and pragmatic aspects.

This restriction was considered a virtue by some experts and a vice by others. More recently, however, various arguments have been made that the theory can be appropriately modified

to account for  
semantic aspects of in-  
formation as well.

Some of the most  
convincing arguments  
in this regard are in-  
cluded in Fred  
Dretske's *Know/edge  
& Flow of Information*  
(The M.L.T. Press,  
Cambridge, Mass.,  
1981) and in this book  
by Guy Ivarsson.
