Passenger screening at commercial airports in the United States has gone through significant changes since the events of Page 86/98

September 11, 2001. In Study response to increased concern over terrorist attacks on aircrafts, the Transportation Security Administration (TSA) has deployed security systems
Page 87/98

of advanced imaging
technology (AIT) to screen passengers at airports. To date (December 2014), TSA has deployed AITs in U.S. airports of two different technologies that use different types Page 88/98

of radiation to detect threats: millimeter wave and X-ray backscatter AIT systems. X-ray backscatter AITs were deployed in U.S. airports in 2008 and subsequently removed from all airports by June 2013 due to Page 89/98

privacy concerns. TSA is looking to deploy a secondgeneration X-ray backscatter AIT equipped with privacy software to eliminate production of an image of the person being screened in order to Page 90/98

alleviate these concerns. This report reviews previous studies as well as current processes used by the Department of Homel and Security and equipment manufacturers to estimate Page 91/98

Ray Machines examines whether exposures comply with applicable health and safety standards for public and occupational exposures to ionizing radiation and whether system design, operating Page 93/98

procedures, and maintenance procedures are appropriate to prevent over exposures of travelers and operators to ionizing radiation. This study aims to address concerns about exposure to radiation Page 94/98

from X-ray backscatter AITs raised by Congress, individuals within the scientific community, and others.
