Today many school students are shielded from one of the most important concepts in modern science: evolution. In engaging and conversational style, Teaching About Evolution and the Nature of Science provides a well-structured framework for understanding and teaching evolution. Written for teachers, parents, and community officials as well as scientists and educators, this book describes how evolution reveals both the great diversity and similarity among the Earth's organisms; it explores how scientists approach the question of evolution; and it illustrates the nature of science as a way of knowing about the natural world. In addition, the book provides answers to frequently asked questions to help readers understand many of the issues and misconceptions about evolution. The book includes sample activities for teaching about evolution and the nature of science. For example, the book includes activities that investigate fossil footprints and population growth that teachers of science can use to introduce principles of evolution. Background information, materials, and step-by-step presentations are provided for each activity. In addition, this volume: Presents the evidence for evolution, including how evolution can be observed today. Explains the nature of science through a variety of examples. Describes how science differs from other human endeavors and why evolution is one of the best avenues for helping students understand this distinction. Answers frequently asked questions about evolution. Teaching About Evolution and the Nature of Science builds on the 1996 National Science Education Standards released by the National Research Council—and offers detailed guidance on how to evaluate and choose instructional materials that support the standards. Comprehensive and practical, this book brings one of today's educational challenges into focus in a balanced and reasoned discussion. It will be of special interest to teachers of science, school administrators, and interested members of the community.

An accessible and engaging primer on the history of the universe and life on Earth. In this delightful book, kids can follow the fascinating story of how we got from the beginning of the universe to life today on the "bright blue ball floating in space" called Earth. They'll learn about the big bang theory, how our solar system and planet were formed, how life on Earth began in the oceans and moved to land, what happened to the dinosaurs and how humans evolved from apes to build communities all over the planet ... and even travel to space! Kids will be enthralled by this out-of-this-world look at how the universe began!

Charlie Liebert was converted to Christ at age thirty-five from hardcore Atheism. Because he understands how Atheists think, he effectively spreads the gospel through dialogue with unbelievers. Seeing many fellow Christians paralyzed by fear of not being able to answer their questions, he developed here direct, simple, Bible-based answers to those hard questions. In his first book, Always Be Ready to Give an Answer! he proposed a strategy to get to the gospel before answering those hard questions. Now its time to answer them! The four most common questions are: 1) Where did Cain get his wife? 2) What happens to a native in the jungle who never heard the gospel? Does he go to hell? 3) Why do bad things happen to good people? and 4) Materialists statements like: I only believe in what I can see. Faith is for fools! Everything is relative, there are no absolutes! These four questions are each answered in depth to give you firm confidence in your personal evangelism. Over one hundred more questions are answered simply and directly. The conflict between the Bibles Creation account and the Evolution taught in our schools is analyzed to increase your confidence. Your faith will be bolstered by these answers and the analysis of origins. You will be empowered in your witnessing and gain great confidence in your faith. Yes, there are answers to those hard questions! Become a fearless evangelist with real answers for the hope that is in you!

In this book the author, a Harvard evolutionary biologist presents an account of how the human body has evolved over millions of years, examining how an increasing disparity between the needs of Stone Age bodies and the realities of the modern world are fueling a paradox of greater longevity and chronic disease. It illuminates the major transformations that contributed key adaptations to the body: the rise of bipedalism; the shift to a non-fruit-based diet; the advent of hunting and gathering, leading to our superlative endurance athleticism; the development of a very large brain; and the incipience of cultural proficiencies. The author also elucidates how cultural evolution differs from biological evolution, and how our bodies were further transformed during the Agricultural and Industrial Revolutions. While these ongoing changes have brought about many benefits, they have also created conditions to which our bodies are not entirely adapted, the author argues, resulting in the growing incidence of obesity and new but avoidable diseases, such as type 2 diabetes. The author proposes that many of these chronic illnesses persist and in some cases are intensifying because of 'disevolution,' a pernicious dynamic whereby only the symptoms rather than the causes of these maladies are treated. And finally, he advocates the use of evolutionary information to help nudge, push, and sometimes even compel us to create a more salubrious environment. -- From publisher's web site.

Explores how Xu Bing and other contemporary Chinese artists use Western ideas within a Chinese cultural discourse.

Provides answers to commonly asked questions such as "Why does my skin wrinkle in the tub?" and "Why do we see a rainbow?"

Theologians, philosophers and scientists all have differing views of the world but what is the real abiding reality? Most are afraid to "cross the streams" so to speak of these distinct disciplines but suppose, we could gather together a group of these adherents to discuss the questions that people consider to taboo to talk about in public like the relationship of faith, fact or fantasy. Where would that conversation, its tangents or derivatives lead? This book attempts to answer those questions of the mind that every rational person has at some point in their life. To do that we must engage in discussions about reality, absurdity, perception, Truth, consciousness as well as Godel's preverbal incompleteness. While discussing the origin of the cosmos the topic will migrate from Transformers and UFO's to how multidimensionality could be related to miracles. The theme of the book examines the "freaky truths" of the relationship of these divergent disciplines and beliefs. As such, the main characters will be the Sovereign of the Universe and His history verses that of the scientific and philosophical communities. In answering the Problem of Evil (alone worth the cost) we invariably meet the Hostis humani generis = the enemy of humanity: Satan. Hopefully, a rocking good time will be had by everyone who ventures to buy the book. P.S. Don't be surprised if you find a few spooky parts as well!

Popular Science gives our readers the information and tools to improve their technology and their world. The core belief that Popular Science and our readers share: The future is going to be better, and science and technology are the driving forces that will help make it better.

The stories of fifty-seven jazz and pop albums that have become benchmarks by which subsequent records have been measured.
