Evolution The Human Story by Dr Alice Roberts This unrivalled illustrated guide to human evolution brings you face to face with your ancient ancestors. Travelling back in time almost eight million years, the book charts the development of our species, Homo sapiens, from tree-dwelling primates to modern humans.

Fully updated with the latest discoveries and research, amazingly realistic illustrations and detailed maps plot eight million years of human development in the context of our genetics, anatomy, behavior, environment, migrations, and culture. This unrivald illustrated guide to human evolution brings you face-to-face with your ancient ancestors. Traveling back in time almost eight million years, the book charts the development of our species, Homo sapiens, from tree-dwelling primates to modern humans. Evolution investigates each of our ancestors in detail and in context, from the anatomy of their bones to the environment they lived in. Key fossil finds are showcased on double-page feature spreads. Detailed maps show where each species has been found and plot the gradual spread of humans around the world. The book has been fully updated to include the latest discoveries and research—including the newly discovered species Homo naledi—and presents the latest thinking on some of the most captivating questions in science, such as whether modern humans and Neanderthals interacted with each other. Written and authenticated by a team of acknowledged experts and illustrated by renowned Dutch paleoartists the Kennis brothers, Evolution presents the story of our species with unique richness, authority, and detail.

Ancient relics—stone tools, bones, footprints, and even DNA—offer many clues about our human ancestors and how they lived. At the same time, our kinship with our human ancestors lies as much in their sense of humor, their interactions with others, their curiosity and their moments of wonder, as it does in the shape of their bones and teeth. And the evolution of human behavior left no direct fossil traces. Children of time brings this vanished aspect of the human past to life through Anne Weaver’s scientifically-informed imagination. The stories move through time, following the lives of long-ago hominins through the eyes of their children. Each carefully researched chapter is based on an actual child fossil—a baby, a five-year-old, a young adolescent, and teenagers. The children and their families are brought to life through illustrator Matt Colesky’s vividly rendered paleoenvironments where they encounter saber-toothed cats, giraffids, wild dogs, fearsome crocodiles, and primitive horses. Their adventures invite readers to think about what it means to be human, and to speculate on the human drama as it unfolds in many dimensions, from social organization and technology to language, music, art, and religious consciousness. How did we get here? Where did we come from? Trace your biological origins and come face to face with your ancient ancestors through this unrivald illustrated guide to human evolution. Traveling back in time almost eight million years, Evolution charts the development of our species, Homo sapiens, from tree-dwelling primates to modern humans. The book investigates each of our ancestors in detail and in context, from the anatomy of their bones to the environment they lived in. Double-page features on key fossil finds as well as maps depicting movement and migration offer comprehensive insight. The book has been fully updated to include the latest discoveries and research - including the newly discovered species Homo naledi - and presents the latest thinking on some of the most captivating questions in science, such as whether modern humans and Neanderthals interacted with each other. Edited by celebrated anthropologist Dr. Alice Roberts and illustrated by renowned Dutch paleoartists the Kennis brothers, Evolution presents the story of our species with eye-popping visuals, unique richness, and authority.

Dan Lieberman has written an innovative, exhaustively researched and carefully argued book dealing with the evolution of the human head. In it he addresses three interrelated questions. First, why does the human head look the way it does? Second, why did these transformations occur? And third, how is something as complex and vital as the head so variable and evolvable? This book addresses these questions in three sections. The first set of chapters review how human and ape heads grow, both in terms of individual parts (organs and regions) and as an integrated whole. The second section reviews how the head performs its major functions: housing the brain, chewing, swallowing, breathing, vocalizing, thermoregulating, seeing, hearing, tasting, smelling, and balancing during locomotion. The final set of chapters review the fossil evidence for major transformations of the head during human evolution from the divergence of the human and ape lineages through the origins of Homo sapiens. These chapters use developmental and functional insights from the first two sections to speculate on the developmental and selective bases for these transformations.

It’s time for a story of human evolution that goes beyond describing “ape-men” and talks about what women and children were doing. In a few decades, a torrent of new evidence and ideas about human evolution has allowed scientists to piece together a more detailed understanding of what went on thousands and even millions of years ago. We now know much more about the problems our ancestors faced, the solutions they found, and the trade-offs they made. The drama of their experiences led to the humans we are today: an animal that relies on a complex culture. We are a species that can and does rapidly evolve cultural solutions as we face new problems, but the intricacies of our cultures mean that this often creates new challenges. Our species’ unique capacity for culture began to evolve millions of years ago, but it only really took off in the last few hundred thousand years. This capacity allowed our ancestors to survive and raise their difficult children during times of extreme climate chaos. Understanding how this has evolved can help us understand the cultural change and diversity that we experience today. Lesley Newson and Peter Richerson, a husband-and-wife team based at the University of California, Davis, began their careers with training in biology. The two have spent years together and individually researching and collaborating with scholars from a wide range of disciplines to produce a deep history of humankind. In A Story of Us, they present this rich narrative and explain how the evolution of our genes relates to the evolution of our cultures. Newson and Richerson take readers through seven stages of human evolution, beginning seven million years ago with the apes that were the ancestors of humans and today’s chimps and bonobos. The story ends in the present day and offers a glimpse into the future.

Principles of Human Evolution presents an in-depthintroduction to paleoanthropology and the study of human evolution Focusing on the fundamentals of evolutionary theory and how theseapply to ecological, molecular genetic, paleontological andarcheological approaches to important questions in the field, thistimey textbook will help students gain a perspective on humanevolution in the context of modern biological thinking. The second edition of this successful text features the additionof Robert Foley, a leading researcher in Human EvolutionaryStudies, to the writing team. Strong emphasis on evolutionarytheory, ecology and behavior and scores of new examples reflect thelatest evolutionary theories and recent archaeological finds. Morethan a simple update, the new edition is organized by issue ratherthan chronology, integrating behavior, adaptation and anatomy. Anew design and new figure references make this edition moreaccessible for students and instructors. New author, Robert Foley – leading figure in HumanEvolutionary Studies – joins the writing team. Dedicated website – www.blackwellpublishing.com/lewin– provides study resources and artwork downloadable forPowerpoint presentations. Beyond the Facts boxes – explore key scientific debatesin greater depth. Margin Comments – indicate the key points in eachsection. Key Questions – review and test students’ knowledgeof central chapter concepts and help focus the way a studentapproaches reading the text. New emphasis on ecological and behavioral evolution – inkeeping with modern research. Fully up to date with recent fossil finds and interpretations;integration of genetic and paleoanthropological approaches.

In this book the author, a Harvard evolutionary biologist presents an account of how the human body has evolved over millions of years, examining how an increasing disparity between the needs of Stone Age bodies and the realities of the modern world are fueling a paradox of greater longevity and chronic disease. It illuminates the major transformations that contributed key adaptations to the body: the rise of bipedalism; the shift to a non-fruit-based diet; the advent of hunting and gathering, leading to our superlative endurance athleticism; the development of a very large brain; and the incipience of cultural profluencies. The author also elucidates how cultural evolution differs from biological evolution, and how our bodies were further transformed during the Agricultural and Industrial Revolutions. While these ongoing changes have brought about many benefits, they have also created conditions to which our bodies are not entirely adapted, the author argues, resulting in the growing incidence of obesity and new but avoidable diseases, such as type 2 diabetes. The author proposes that many of these chronic illnesses persist and in some cases are intensifying because of ‘dysvolution’, a pernicious dynamic whereby only the symptoms rather than the causes of these maladies are treated. And finally, he advocates the use of evolutionary information to help nudge, push, and sometimes even compel us to create a more salubrious environment. -- From publisher’s web site.

“ Rutherford describes [The Book of Humans] as being about the paradox of how our evolutionary journey turned “ an otherwise average ape ” into one capable of creating complex tools, art, music, science, and engineering. It ’ s an intriguing question, one his book sets against descriptions of the infinitely amusing strategies and antics of a dizzying array of animals. ” —The New York Times Book Review Publisher’s Note: The Book of Humans was previously published in hardcover as Humankind. In this new evolutionary history, geneticist Adam Rutherford explores the profound paradox of the human animal. Looking for answers across the animal kingdom, he finds that many things once considered exclusively human are not: We aren ’ t the only species that “ speaks, ” makes tools, or has sex outside of procreation. Seeing as our genome is 98 percent identical to a chimpanzee ’ s, our DNA doesn ’ t set us far apart, either. How, then, did we develop the most complex culture ever observed? The Book of Humans proves that we are animals indeed—and reveals how we truly are extraordinary.

“ An unforgettable journey through this twisted miracle of evolution we call “ our body. ” —Spike Carlsen, author of A Walk Around the Block From blurry vision to crooked teeth, ACLs that tear at alarming rates and spines that seem to spend a lifetime falling apart, it ’ s a curious thing that human beings have beaten the odds as a species. After all, we ’ re the only survivors on our branch of the tree of life. The flaws in our makeup raise more than a few questions, and this detailed foray into the many twists and turns of our ancestral past includes no shortage of curiosity and humor to find the answers. Why is it that human mothers have such a life-endangering experience giving birth? Why are there entire medical specialties for teeth and feet? And why is it that human babies can ’ t even hold their heads up, but horses are trotting around minutes after they ’ re born? In this funny, wide-ranging and often surprising book, biologist Alex Bezerides tells us just where we inherited our adaptable, acny, brilliant bodies in the process of evolution.

What makes us human, and where did we come from? How did a clever ape climb down from the trees and change the world like no other animal has done before? This large-format, highly illustrated book guides readers through the key aspects of the human story, from the anatomical changes that allowed us to walk upright and increased brain size in our ancestors, to the social, cultural, and economic developments of our more recent cousins and our own species. Along the way, focus spreads take a closer look at some of the key species in our history, from the ancient Australopithecus Afarensis, ‘Lucy’, to our recent cousins the Neanderthals and ourselves, Homo sapiens. Looking beyond the anatomical evolution of humans, this book explores how our culture and way of living has evolved, from how trails of cowry shells reveal early trade between tribes, to how and why humans first domesticated dogs, horses, and farm animals, and began settling in permanent villages and cities. Through digestible information and absorbing illustration, young readers will be given an insight into their own origins, and what it really means to be a human.
