The invention of the laser was one of the towering achievements of the twentieth century. At the opening of the twenty-first century we are witnessing the burgeoning of the myriad technical innovations to which that invention has led. The Handbook of Laser Technology and Applications is a practical and long-lasting reference source for scientists a

Rationality and Religious Commitment shows how religious commitment can be rational and describes the place of faith in the postmodern world. It portrays religious commitment as far more than accepting doctrines—it is viewed as a kind of life, not just as an embrace of tenets. Faith is conceived as a unique attitude. It is irreducible to belief but closely connected with both belief and conduct, and intimately related to life's moral, political, and aesthetic dimensions. Part One presents an account of rationality as a status attainable by mature religious people—even those with a strongly scientific habit of mind. Part Two describes what it means to have faith, how faith is connected with attitudes, emotions, and conduct, and how religious experience may support it. Part Three turns to religious commitment and moral obligation and to the relation between religion and politics. It shows how ethics and religion can be mutually supportive even though ethics provides standards of conduct independently of theology. It also depicts the integrated life possible for the religiously committed—a life with rewarding interactions between faith and reason, religion and science, and the aesthetic and the spiritual. The book concludes with two major accounts. One explains how moral wrongs and natural disasters are possible under God conceived as having the knowledge, power, and goodness that make such evils so difficult to understand. The other account explores the nature of persons, human and divine, and yields a conception that can sustain a rational theistic worldview even in the contemporary scientific age.

Little Book of the Audi Quattro is a 128-page hardback book written by Stan Fowler and Charlotte Morgan. Developed using four wheel drive technology, the Audi quattro stands out as one of the most revolutionary sports cars ever built. From its debut in the 1980s, the quattro was set to steal the show and it went on to do just that both on and off road. Today, it is a much loved classic with fans and quattro enthusiasts the world over. Originally, Audi had intended to produce just 400 quattros to be used in rally driving, but in the end, nearly 11,500 vehicles were built for a hungry export market. The car was unveiled at the Geneva Motor Show in March 1980 and as the first four-wheel drive grand tourer since 1966 it caused a sensation. The car became one of the most significant rally cars of all time when it was one of the first to take advantage of the changed rules in competition racing allowing a four-wheel drive to participate. Critics were sceptical that a four-wheel drive could achieve as near as much momentum, power and versatility. They were to be proved wrong.

Transcending two of the most widely misunderstood positions in philosophy,--foundationalism and coherentism, this collection of papers by a renowned epistemologist offers a theory of rationality as well as an account of knowledge and justified belief.

The three-volume work *Perceiving in Depth* is a sequel to *Binocular Vision and Stereopsis* and to *Seeing in Depth*, both by Ian P. Howard and Brian J. Rogers. This work is much broader in scope than the previous books and includes mechanisms of depth perception by all senses, including aural, electrosensory organs, and the somatosensory system. Volume 1 reviews sensory coding, psychophysical and analytic procedures, and basic visual mechanisms. Volume 2 reviews stereoscopic vision. Volume 3 reviews all mechanisms of depth perception other than stereoscopic vision. The three volumes are extensively illustrated and referenced and provide the most detailed review of all aspects of perceiving the three-dimensional world. Volume 1 starts with a review of the history of visual science from the ancient Greeks to the early 20th century with special attention devoted to the discovery of the principles of perspective and stereoscopic vision. The first chapter also contains an account of early visual display systems, such as panoramas and peepshows, and the development of stereoscopes and stereophotography. A chapter on the psychophysical and analytic procedures used in investigations of depth perception is followed by a chapter on sensory coding and the geometry of visual space. An account of the structure and physiology of the primate visual system proceeds from the eye through the LGN to the visual cortex and higher visual centers. This is followed by a review of the evolution of visual systems and of the development of the mammalian visual system in the embryonic and post-natal periods, with an emphasis on experience-dependent neural plasticity. An account of the development of perceptual functions, especially depth perception, is followed by a review of the effects of early visual deprivation during the critical period of neural plasticity on amblyopia and other defects in depth perception. Volume 1 ends with accounts of the accommodation mechanism of the human eye and vergence eye movements.
