A gross premium valuation (GPV) involves a projection of the liability premiums, benefits, and expenses. It determines the value of a book of business based on the present value of the benefits and expenses less gross premiums. A liability model is necessary, along with a projection based on that model and reasonable.

Gross premiums are the amounts an insurance company expects to receive over the life of a policy term. This affects the amount the policyholder will pay for coverage under the insurance contract. For example, if a policyholder pays \$1,000 for a six-month automobile insurance policy, the gross premiums for that period are \$1,000. Video of the Day

attained states of equilibrium. It is silent about the processes of adjustment to equilibrium; Human action consists of 'grappling with an essentially unknown future', not being confronted with clearly specified objectives, known resources and defined courses of action as mainstream theory assumes; Critics of the market economy find ammunition in neo-classical theory: they 'merely need to tick off the respects in which real world capitalism departs from the requirements for perfectly competitive optimality'; The theory of entrepreneurial discovery allows economists to escape from the 'analytical box' in which 'choice' simply consists of computing a solution implicit in given data; An entrepreneurial act

of discovery consists in 'realising the existence of market value that has hitherto been overlooked'.

Scope for entrepreneurial discovery occurs in a world of disequilibrium -- which is quite different from the equilibrium world of mainstream economics where market outcomes are foreordained; Entrepreneurial discovery explains why one price tends to prevail in a market. Though new causes of price differences continually appear, entrepreneurs exploit the resulting profit opportunities and produce a tendency towards a single price; Only with the introduction of entrepreneurship is it possible to appreciate how markets work. Without entrepreneurship, there would be no market co-ordination;

So-called 'imperfections' of competition are often 'crucial elements in the market process of discovery and correction of earlier entrepreneurial errors'; Advertising expenditures, for example, are means of alerting consumers to 'what they do not know that they do not know'. Anti-trust laws may hamper market processes and prevent competitive entry to markets; so. Entrepreneurial profit, far from generating injustice, is a 'created gain'. It is not `sliced from a pre-existing pie ... it is a portion which has been created in the very act of grasping it'.

insurance companies. In addition, the contributions discuss the disclosure of these values to the financial and regulatory communities and auditing firms which are actually calculating this illusive but important variable. It combines contributions by distinguished practitioners from the insurance, accounting and finance fields, with those of prominent academics. One of the central themes of the collection is that adequate disclosure of the true economic value of insurance company liabilities is both possible and desirable. Wherever possible, the insurance valuation process is wedded with modern financial theory. For example, the use of option pricing theory is applied to insurance companies, where the

One of the most complex issues in tax policy today is the treatment of the institutions, products, and services that make up the financial sector. It can be harder to ascertain income, expenses, and profits for financial firms than for firms selling goods and services, and it is easier for individuals and firms to manipulate financial transactions so as to exploit tax loopholes. This volume explores the challenges faced by tax policymakers and identifies modern best practices in several
