Over the past decade or so, systems integration has become a key factor in the operations, strategy and competitive advantage of major corporations in a wide variety of sectors (e.g. computing, automotive, telecommunications, military systems and aerospace). Systems integration is a strategic task that pervades business management not only at the technical level but also at the management and strategic levels. This book shows how and why this new kind of systems integration has evolved into an emerging model of industrial organization whereby firms, and groups of firms, join together different types of knowledge, skill and activity, as well as hardware, software, and human resources to produce new products for the marketplace. This book is the first to systematically explore systems integration from a business and innovation perspective. Contributors delve deeply into the nature, dimensions and dynamics of the new systems integration, deploying research and analytical techniques from a wide variety of disciplines including, the theory of the firm, the history of technology, industrial organization, regional studies, strategic management, and innovation studies. This wealth of research capability provides deep insights into the new model of systems integration and supports this with an abundance of empirical evidence. The book is organized in three main parts. The first part focuses on the history of systems integration. Contributors trace the early history of systems integration using different industrial examples. The second part presents theoretical and analytical aspects of systems integration. Contributions concentrate on the regulatory and cognitive features of systems integration, the relationships between systems integration and regional competitive advantage, and the way in which systems integration supports the competitive advantage of firms. The third part takes industry and firm-level approaches. Contributions focus on different sectors and highlight the specificity of systems integration in various industrial domains, stressing its importance for systems integration in the case of complex capital goods, such as aircraft and telecommunications equipment, as well as consumer goods, such as personal computers and automobiles.

The 21st century has seen a number of advancements in technology, including the use of high performance computing. Computing resources are being used by the science and economy fields for data processing, simulation, and modeling. These innovations aid in the support of production, logistics, and mobility processes. Integrated Information and Computing Systems for Natural, Spatial, and Social Sciences covers a carefully selected spectrum of the most up to date issues, revealing the benefits, dynamism, potential, and challenges of information and computing system application scenarios and components from a wide spectrum of prominent disciplines. This comprehensive collection offers important guidance on the development stage of the universal solution to information and computing systems for researchers as well as industry decision makers and developers.

This thesis investigates the development of capabilities by incumbent telecommunications operators in the context of the transition to the Next Generation Network (NGN). In particular, it examines the case of BT in the UK, as a large-scale first mover in this transition. The research is based on recent developments in the telecommunications industry, and the empirical evidence was obtained through documentary analysis and a large number of interviews. Using the resource-based view (RBV) as a foundation, the wider theoretical contribution of this thesis lies in the proposition that integrated solutions are constructed through the combination of platform strategy, project business and service innovation. A unique contribution is to consider the customer/user perspective, as the traditional literature on integrated solutions relies heavily on the supplier perspective. Another specific contribution is in the integration of two aspects of the platform strategy that are usually treated separately in the literature: (i) the reusability of components and subsystems; and (ii) the openness of the platform to external actors in order to drive innovation in the industry. The empirical evidence points to the development of the following approaches by BT: (i) the deployment of the network as a platform, integrating both aspects mentioned above; (ii) the adoption of a customer-centric approach which resulted in the establishment of a new business unit, BT Global Services (BTGS), that required the development of stronger capabilities in integrated solutions, especially in professional services (i.e. consultancy, project management and systems integration); (iii) the use of the term ‘open innovation’ as a management injunction within BT in order to coordinate several initiatives which bring together internal and external collaborators and resources to innovate in services. The above approaches, however, have not changed BT’s core capability in the provision of network/infrastructure services. The challenge is to connect BT’s platform to their customers’ networks and to shape long-term relationships to enhance the profitability of the integrated solutions. Finally, the findings suggest that the platform and customercentric strategies may not be enough (or even be the right ones) for the survival and growth in the long-term future of BT in the telecommunications industry. This is evidenced by the recent failure (as of 2008) of BTGS to provide professional services profitably.

Forensic Mental Health: Framing Integrated Solutions describes a criminal justice–mental health nexus that touches every population—juvenile and adult male and female offenders, probationers and parolees, the aging adult prison population, and victims of crime. In the United States today, the criminal justice system functions as a mental health provider, but at great cost to society. The author summarizes the historical roots of this crisis and provides an overview of mental illness and symptoms, using graphics to illustrate the most prevalent disorders encountered by police and other first responders. Bratina demonstrates in detail how the Sequential Intercept Model (SIM) supports integration of the U.S. healthcare and justice systems to offer more positive outcomes for offenders with mental illness. This book takes a multidisciplinary approach, addressing social work, psychology, counseling, and special education, and covers developments such as case-law related to the right to treatment and trauma-informed care. Designed for advanced undergraduates, this text also serves as a training resource for practitioners working with the many affected justice-involved individuals with mental illness, including juveniles, veterans, and substance abusers.
