This is the first text in a
generation to re-
examine the purpose of
the mathematical
statistics course. The

book's approach interweaves traditional topics with data analysis and reflects the use of the computer with close ties to the practice of statistics. The author stresses analysis of data, examines real problems with real data, and motivates the theory. The book's descriptive statistics, graphical displays, and realistic

applications stand in strong contrast to traditional texts that are set in abstract settings.

The fundamental
mathematical tools

needed to understand machine learning include linear algebra, analytic geometry, matrix decompositions, vector calculus, optimization, probability and statistics. These topics are traditionally taught in disparate courses, making it hard for data science or computer science students, or

professionals, to efficiently learn the mathematics. This self-contained textbook bridges the gap between mathematical and machine learning texts, introducing the mathematical concepts with a minimum of prerequisites. It uses these concepts to derive four central machine learning methods: linear

regression, principal component analysis, Gaussian mixture models and support vector machines. For students and others with a mathematical background, these derivations provide a starting point to machine learning texts. For those learning the mathematics for the first time, the methods help

build intuition and practical experience with applying mathematical concepts.

Every chapter includes worked examples and exercises to test understanding.

Programming tutorials are offered on the book's web site.

This book constitutes the refereed proceedings of the 16th International Conference on

Innovations for Community Services, I4CS 2016, held in Vienna, Austria, in June 2016. The 12 revised full papers presented together with two short papers were carefully reviewed and selected from 30 submissions.

The papers are organized in topical sections on navigation and data management; monitoring and decision making; coding and security; collaboration and workflow; routing and technology; topic and object tracking.

The new edition of this influential textbook, geared towards graduate

or advanced undergraduate students, teaches the statistics necessary for financial engineering. In doing so, it illustrates concepts using financial markets and economic data, R Labs with real-data exercises, and graphical and analytic methods for modeling and diagnosing modeling errors. These methods

are critical because financial engineers now have access to enormous quantities of data. To make use of this data, the powerful methods in this book for working with quantitative information, particularly about volatility and risks, are essential. Strengths of this fully-revised edition include major additions to the R

code and the advanced topics covered. Individual chapters cover, among other topics, multivariate distributions, copulas, Bayesian computations, risk management, and cointegration. Suggested prerequisites are basic knowledge of statistics and probability, matrices and linear algebra, and calculus.

There is an appendix on probability, statistics and linear algebra. Practicing financial engineers will also find this book of interest.
