The eighth workshop continued that approachandwascombinedwiththeIFIPWorkingConferenceonHumanError, Safety and Systems Development, HESSD 2009. There is an obvious synergy between the two workshops, as a rigorous, engineering approach to user interface development can help in the prevention of human error and the maintenance of safety in critical interactive systems. The 12 papers presented here take a variety of approaches and cover different domains of the application of task modeling. We begin with higher-level perspectives on business processes that enable us to drive user interface development. Aspects of the general design process are also considered and applied to service-oriented and augmented reality interaction. Formal methods are also investigated for more rigorous development. Model-driven development is also recognized for its contribution to high-level interface design, and continuing the software engineering theme, approaches based on UML are presented. Sousa et al. propose a model-driven approach to linking business processes with user interface models. Their approach is demonstrated in the context of a large financial institution and they show how the alignment between UI models and business can be managed, taking advantage of the traceability provided by model-driven design. Neubauer et al. also consider a flow-oriented modeling of business processes as a more open
