Jack Meredith has written eight books on operations management, project management and management science, and his research focus is on the strategic and operational problems that managers face, particularly those concerning the management of advanced technology. Scott Shafer, one of the nations first college professors to earn the Black Belt Six Sigma certification through the American Society for Quality (ASQ), integrates Six Sigma into educational programs as Director of MA Program and Professor of Management.

Across the country ambulances are turned away from emergency departments (EDs) and patients are waiting hours and sometimes days to be admitted to a hospital room. Hospitals are finding it hard to get specialist physicians to come to treat emergency patients. Our EDs demand a new way of thinking. They are not at a tipping point; they are at a breaking point. Under current loads and trends they are going to begin to break and these breakdowns will be painful and ultimately dangerous to society. Recognizing that the ideal in health care is presently beyond our immediate grasp, this book instead focuses on providing health care leaders with the tools they can employ to optimize the performance of EDs and thereby improve service to patients, employees, and communities. Written by 20 of the most progressive and successful health care reformers in the country, the approaches described can be utilized to quantify improvements, enhance predictability of workflow, and improve staff scheduling. The data derived using these techniques can serve as powerful evidence in support of change. While a common discussion among ED professionals is the perception that many patients are not really emergency patients and could be treated in another setting at another time, that argument is not germane until we as a nation elect to reform the way we chose to deliver healthcare to the underserved. In the meantime this book provides invaluable information to help individual hospitals to retool their ED's. It offers new approaches that think outside of the box for all stakeholders. It also provides the statistical evidence that administrators need to make their cases for changes and added resources. It will help you forecast the demand for services and give your center an approach that will allow the ED to become a source of income rather than one that continues to hemorrhage needed limited health care funding.

Describes how to build a competitive edge by developing superior operations This comprehensive, practice-oriented textbook shows how healthcare organizations can gain a competitive edge through superior operations. A strategic perspective is taken by achieving excellence in the four competitive priorities: quality, cost, timely delivery, and flexibility. The competitive priorities should not be pursued in isolation. They are indeed interrelated, and we show how initiatives targeted at improving performance in each of the four competitive priorities impact one another and have synergistic effects. Upon completion of the course, students will have developed a conceptual mental model of health care operations in which all concepts and tools fit together. They will recognize the dangers of pursuing local optimization and appreciate the benefits of aligning the entire operations system with the business strategy. The book shows how to run a healthcare organization. We highlight the different perspectives of clinicians and administrators and attempt to resolve their conflicts by offering a common platform for building competitive advantage. To bring the cultural context to life, we engage students with a series of short stories showcasing the struggles of a fictitious health care organization as it embarks on its journey to becoming a highly reliable organization. Our approach is very "hands-on." Throughout the book, we help students develop a tool kit to assist in problem solving and process

Questions at the end of each story segment help stimulate class discussion and reflection • Box features with frequently asked student questions and our answers (LET'S TALK!) • Box features with real-world implementations of the concepts (OM IN PRACTICE!) • Data files available for statistical process control, queuing, and simulation • Comprehensive Instructor Packet and online tutorials
