Energy markets are regularly undergoing considerable transitions to accommodate new (renewable) energy forms, new (decentral) energy players, and new system requirements, e.g. flexibility and resilience. Traditional energy markets for fossil fuels are therefore under pressure, while not-yet-mature (renewable) energy markets are emerging. As a consequence, investments in large-scale and capital intensive (traditional) energy production projects are surrounded by high uncertainty, and are difficult to hedge by private entities. Traditional energy production companies are transforming into energy service suppliers and companies aggregating numerous potential market players are emerging, while regulation and system management are playing an increasing role. To address these increasing uncertainties and complexities, economic analysis, forecasting, modeling and investment assessment require fresh approaches and views. Novel research is thus required to simulate multiple actor interplays and idiosyncratic behavior. The required approaches cannot deal only with energy supply, but need to include active demand and cover systemic aspects. Energy market transitions challenge policy-making. Market coordination failure, the removal of barriers hindering restructuring and the combination of market signals with command-and-control policy measures are some of the new aims of policies. The aim of this Special Issue is to collect research papers that address the above issues using novel methods from any adequate perspective, including economic analysis, modeling of systems, behavioral forecasting, and policy assessment. The issue will include, but is not be limited to: Local control schemes and algorithms for distributed generation systems Centralized and decentralized sustainable energy management strategies Communication architectures, protocols and properties of practical applications Topologies of distributed generation systems improving flexibility, efficiency and power quality Practical issues in the control design and implementation of distributed generation systems Energy transition studies for optimized pathway options aiming for high levels of sustainability

It was the most brutal corporate restructuring in Wall Street history. The 2015 bankruptcy brawl for the storied casino giant, Caesars Entertainment, pitted brilliant and ruthless private equity legends against the world's most relentless hedge fund wizards. In the tradition of Barbarians at the Gate and The Big Short comes the riveting, multi-dimensional poker game between private equity firms and distressed debt hedge funds that played out from the Vegas Strip to Manhattan boardrooms to Chicago courthouses and even, for a moment, the halls of the United States Congress. On one side: Apollo Global Management and TPG Capital. On the other: the likes of Elliott Management, Oaktree Capital, and Appaloosa Management. The Caesars bankruptcy put a twist on the old-fashioned casino heist. Through a \$27 billion leveraged buyout and a dizzying string of financial engineering transactions, Apollo and TPG—in the midst of the post-Great Recession slump—had seemingly snatched every prime asset of the company from creditors, with the notable exception of Caesars Palace. But Caesars' hedge fund lenders and bondholders had scooped up the company's paper for nickels and dimes. And with their own armies of lawyers and bankers, they were ready to do everything necessary to take back what they believed was theirs! If they could stop their own infighting. These modern financiers now dominate the scene in Corporate America as their fight-to-the-death mentality continues to shock workers, politicians, and broader society—and even each other. In The Caesars Palace Coup, financial journalists Max Frumes and Sujcet Indap illuminate the brutal tactics of distressed debt mavens/cultures, as they are condemned in the sale and purchase of even the biggest companies in the world with billions of dollars hanging in the balance.
