The study and teaching of international human rights law is dominated by the doctrinal method. A wealth of alternative approaches exists, but they tend to be discussed in isolation from one another. This collection focuses on cross-theoretical discussion that brings together an array of different analytical methods and theoretical lenses that can be used for conducting research within the field. As such, it provides a coherent, accessible and diverse account of key theories and methods. A distinctive feature of this collection is that it adopts a grounded approach to international human rights law, through demonstrating the application of specific research methods to individual case studies. By applying the approach under discussion to a concrete case it is possible to better appreciate the multiple understandings of international human rights law that are missed when the field is only comprehended through the doctrinal method. Furthermore, since every contribution follows the same uniform structure, this allows for fruitful comparison between different approaches to the study of our discipline.

In academic human rights research, especially legal human rights research, little attention tends to be devoted to questions of methodology. One reason for this may be that human rights scholars often are former human rights activists. Dispensing with methodological niceties enables them to engage in wishful thinking and to come up with the conclusions they were hoping to find in the first place. Furthermore, although much emphasis continues to be put on the need to carry out human rights research from a multidisciplinary perspective, the methods to be applied in such research remain far from clear. Which criteria can be identified to qualify a piece of human rights research as a methodologically sound piece of work? Are there aspects and considerations that are typical for human rights research? What are good practices in human rights research? This book addresses these questions from the perspective of different scholarly fields relevant for human rights research, including international law, criminal law, criminology, political science, comparative politics, international relations, anthropology; philosophy, and history. This book is essential reading for any PhD candidate embarking on a dissertation in the field of human rights and any human rights scholar wishing to critically reflect on the quality of her/his own methods of work.

Human rights issues are shaping the modern world. They define the expectations by which nations are judged and affect the policy of governments, corporations, and foundations. Statistics is central to the modern perspective on human rights. It allows researchers to measure the effect of health care policies, the penetration of educational opportunity, and progress towards gender equality. This book describes the statistics that underlie the social science research in human rights. It includes case studies, methodology, and research papers that discuss the fundamental measurement issues.

Written by Ernst Hirsch Ballin, this original Advanced Introduction uncovers the foundations of legal research methods, an area of legal scholarship distinctly lacking in standardisation. The author shows how such methods differ along critical, empirical, and fundamental lines, and how our understanding of these is crucial to overcoming crises and restoring trust in the law. Key topics include a consideration of law as a normative language and an examination of the common objects of legal research.

Effective human rights advocacy and research require the use of statistics, carefully collected and objectively analyzed and presented, using the best techniques available. Statistics that lack credibility are of little value. Those that can be defended against critics can be effective in throwing the light on violations and promoting the observance of human rights for all. The contributors to this book, including experts in political science, public health, law, forensic pathology, and statistics, illustrate good statistical practice in the field of human rights and show the importance of collaboration between statisticians and other professionals. The treatment is largely nonmathematical, and the examples provide broad coverage of all features of the collection and use of statistical data on human rights violations. For readers who would like to do their own analyses, an extensive guide to human rights data sources is included. This book is the first to describe and summarize important issues associated with the collection and uses of human rights statistics.
