Electric currents are fundamental to the structure and dynamics of space plasmas, including our own near-Earth space environment, or “geospace.” This volume takes an integrated approach to the subject of electric currents by incorporating their phenomenology and physics for many regions in one volume. It covers a broad range of topics from the pioneers of electric currents in outer space, to measurement and analysis techniques, and the many types of electric currents. First volume on electric currents in space in over a decade that provides authoritative up-to-date insight on the current status of research Reviews recent advances in observations, simulation, and theory of electric currents Provides comparative overviews of electric currents in the space environments of different astronomical bodies Electric Currents in Geospace and Beyond serves as an excellent reference volume for a broad community of space scientists, astronomers, and astrophysicists who are studying space plasmas in the solar system. The mechanisms by which buildings and infrastructures degrade are complex, as are the procedures and methods for

inspection and for rehabilitation. This book examines the various problems caused by non-uniform deformation changes, poor durability, and natural and human disasters such as earthquakes and fire. Attention is given to the causes and mechanisms of the deterioration. General procedures and commonly used techniques for inspection and evaluation of existing infrastructures are introduced. The desk study, destructive test, and non-destructive test are discussed – in particular the newly developed non-destructive methods for deterioration monitoring. The book then moves on to conventional renovation techniques such as patch and steel plate strengthening, which meet the requirements of normal practice. Special attention is paid to compatibility between repair materials and degraded materials. Fibrous composite materials are then introduced as a basis for innovative repair techniques, and different fibre and matrix properties are outlined, as are newly developed inorganic binders as a matrix for fibrous composites. Finally, advanced rehabilitation techniques using fibrous composite are described.

Fundamental issues such as bonding and failure mechanisms are then discussed in detail. Fibrous composite strengthening techniques for beam, wall, column and slabs are covered, including shear strengthening, flexural strengthening, and fillet winding, as are codes of practice for retrofitting with fibrous composites. This caters to students and academics world-wide and serves as a "tool book" for concrete and structural engineering professionals.

This new and engaging core textbook offers a unique line manager perspective that presents students with HRM topics and issues that they will be confronted with once they enter the world of work in a managerial role. It is a concise text that

focuses on providing students with all they need to know to equip them with a comprehensive understanding of the role the (non-HR) manager plays in the day-to-day running of an organization. The author's deep understanding and wide-ranging knowledge of the subject matter means that the text is firmly founded on the latest research, while the case studies, topical and international examples, and experiential exercises that form a fundamental part of the book ensure that theory is always clearly applied to real-world practice. This text is an essential companion for MBA and postgraduate students who are studying modules on Human Resource Management or Managing People but who are non-HRM specialists and do not require the exhaustive detail found in other HRM texts. It is also suited for use alongside upper-level undergraduate modules on these topics on mainstream business degrees.
