bad stilling wells, the FlexLine tank gauging system maintains its ultra-high performance level on a wide range of applications and various tank conditions.

FlexLine Radar - Honeywell Process

SmartRadar FlexLine is TÜV certified for use in safety rated loops up to SIL 3 as per IEC 61508, meets major recommendations such as API 2350 and is widely used in overfill protection loops to prevent overfill accidents. With a modular build, SmartRadar FlexLine, provides flexibility, letting you add options easily.

has 24 elements; all are used for reception, while 16 are used for creating virtual receiver beams through digital beamforming. The beams' vertical elevation, and compensation for ship movement, is ...

SMART-L - Wikipedia

SMART-S Signaal Multibeam Acquisition Radar for Tracking, S band is a naval medium to long-range air and surface surveillance multibeam passive electronically scanned array 3D radar designed by Thales Nederland, formerly Hollandse Signaalapparaten (Signaal). SMART-S Mk2 is very successful. Only six years after its introduction, 30 systems were sold to navies all over the world.

SMART-Radar

Far partire una routine di Google Home da IFTTT (GUIDA Universale) - Video dimostrativo - Duration: 2 minutes, 50 seconds.

The antenna is the most critical single component of a communication and sensing system. It not only provides the basic transformation between the electrical signals and electromagnetic waves, but also governs the signal-to-noise ratio which limits the

performance of the signal processing and the entire system. The antenna design - both construction and pattern - must account for different system requirements. In diversity/MIMO applications, where the goal is to mitigate multipath-induced signal fading (or improve capacity, error rate, range, coverage, and a host of other performance metrics), it is normally beneficial to have broad patterns for matching to the broad angular range of the multipath, and polarization purity is not a priority. In a polarimetric radar, the target is usually within a narrow angular range, and different combinations of polarizations in the transmit and receive provide different information. These connections between the antenna and the signal processing, for different applications, motivate the new designs presented in this dissertation. The first part concerns multi-element designs for diversity and MIMO, used for portable terminals in broadcast, Wi-Fi and cellular systems. Performance evaluation using the patterns and statistical models for the multipath propagation is the key design tool. The von-Mises Fisher distribution is introduced for evaluating the impact of directivity in the multipath. The antenna construction is typically PCB-based since the products must be very low cost and compact. The second part strives for higher directivity using new designs of fixed arrays. These designs include dual-polarization, multiple frequency bands, and circular polarization. The construction is slotted metallic cavities because of the low loss in both the elements and the feed (distribution of power over the aperture), and the potential simplicity of manufacture, given the higher directivity of polarized illumination. The final part discusses new radar signal processing for indoor fall

Download Free Smartradar

detection. A radar system was developed and tested, and demonstrates the detection of falls, breathing, and other movements, even when a person has fallen and is on the floor. Deep learning algorithms are used with new experiments providing the training data for distinguishing a person from other moving entities such as pets, reducing the false-alarm rate of the fall detection.
