It's de Waal's message about animal learning that tumbles the final barricade between humans and their kin. The title of this book is derived from apprentice sushi chefs spending years merely observing a master until they can demonstrate their own abilities. In a similar manner, our ape cousins learn by watching and imitating.

For over a century, UFO spotters have told us that we are not alone. In *The Ape and the Sushi Master*, Frans de Waal makes the equally startling claim that, biologically speaking, we never were. (source: Nielsen Book Data) Arguing that apes have created their own distinctive culture, eminent primatologist Frans de Waal challenges our most basic assumptions about who we are and how we differ from other animals..

The ape and the sushi master : cultural reflections by a ...

THE APE AND THE SUSHI MASTER speaks to the similar teaching techniques used by mother apes and Sushi chefs. Apprentice cooks and young apes both learn through years of observation and imitation. Reading this book will give you insights into not only how we view animals and what the nature of culture is, but it also has something to say about how we view ourselves.

What if apes had their own culture rather than an imposed human version? What if they reacted to situations with behavior learned through observation of their elders (culture) rather than with pure genetically coded instinct (nature)? In answering these questions, eminent primatologist Frans de Waal corrects our arrogant assumption that humans are the only creatures to have made the leap from the natural to the cultural domain. The book's title derives from an analogy de Waal draws between the way behavior is transmitted in ape society and the way sushi-making skills are passed down from sushi master to apprentice. Like the apprentice, young apes watch their group mates at close range, absorbing the methods and lessons of each of their elders' actions. Responses long thought to be instinctive are actually learned behavior, de Waal argues, and constitute ape culture. A delightful mix of intriguing anecdote, rigorous clinical study, adventurous field work, and fascinating speculation, *The Ape and the Sushi Master* shows that apes are not human caricatures but members of our extended family with their own resourcefulness and dignity.

Primatologist Frans de Waal has published a number of books on chimpanzee behaviour, including *Peacemaking Among Primates*. In *The Ape and The Sushi Master* the author continues his explorations of human and primate culture in order to arrive at a better understanding of the roots of human behaviour. De Waal's study examines whether animals learn from one another and have what he defines as culture, or whether their actions are purely based on genetics and instinct.

From the New York Times bestselling author of *Mama's Last Hug* and *Are We Smart Enough to Know How Smart Animals Are?*, a provocative argument that apes have created their own distinctive cultures. In *The Ape and the Sushi Master*, eminent primatologist Frans de Waal corrects our arrogant assumption that humans are the only creatures to have made the leap from the natural to the cultural domain. Primatologist Frans de Waal examines how empathy comes naturally to a great variety of animals, including humans.

How did we become the linguistic, cultured, and hugely successful apes that we are? Our closest relatives--the other mentally complex and socially skilled primates--offer tantalizing clues. In *Tree of Origin* nine of the world's top primate experts read these clues and compose the most extensive picture to date of what the behavior of monkeys and apes can tell us about our own evolution as a species. It has been nearly fifteen years since a single volume addressed the issue of human evolution from a primate perspective, and in that time we have witnessed explosive growth in research on the subject. *Tree of Origin* gives us the latest news about bonobos, the make love not war apes who behave so dramatically unlike chimpanzees. We learn about the tool traditions and social customs that set each ape community apart. We see how DNA analysis is revolutionizing our understanding of paternity, intergroup migration, and reproductive success. And we confront intriguing discoveries about primate hunting behavior, politics, cognition, diet, and the evolution of language and intelligence that challenge claims of human uniqueness in new and subtle ways. *Tree of Origin* provides the clearest glimpse yet of the apelike ancestor who left the forest and began the long journey toward modern humanity.

Does your dog know when you've had a bad day? Can your cat tell that the coffee pot you left on might start a fire? Could a chimpanzee be trained to program your computer? In this provocative book, noted animal expert Clive Wynne debunks some commonly held notions about our furry friends. It may be romantic to ascribe human qualities to critters, he argues, but it's not very realistic. While animals are by no means dumb, they don't think the same way we do. Contrary to what many popular television shows would have us believe, animals have neither the "theory-of-mind" capabilities that humans have (that is, they are not conscious of what others are thinking) nor the capacity for higher-level reasoning. So, in Wynne's view, when Fido greets your arrival by nudging your leg, he's more apt to be asking for dinner than commiserating with your job stress. That's not to say that animals don't possess remarkable abilities--and *Do Animals Think?* explores countless examples: there's the honeybee, which not only remembers where it found food but communicates this information to its hive mates through an elaborate dance. And how about the sonar-guided bat, which locates flying insects in the dark of night and devours lunch on the wing? Engagingly written, *Do Animals Think?* takes aim at the work of such renowned animal rights advocates as Peter Singer and Jane Goodall for falsely humanizing animals. Far from impoverishing our view of the animal kingdom, however, it underscores how the world is richer for having such a diversity of minds--be they of the animal or human variety.

Many of the papers in this volume were first presented at the Third International Great Apes of the World Conference, held July 3-6, 1998 in Kuching, Sarawak, Malaysia. The editors of this volume, the first in a two-volume series, are world renowned, having dedicated most of their lives to the study of great apes. The world's premiere primatologists, ethologists, and anthropologists present the most recent research on both captive and free-ranging African great apes. These scientists, through deep personal commitment and sacrifice, have expanded their knowledge of chimpanzees, bonobos, and gorillas. With forests disappearing, many of these studies will never be duplicated. This volume, and all in the *Developments in Primatology* book series, aim to broaden and deepen the understanding of this valuable cause.

A Future for Criticism considers why fiction gives so much pleasure, and the neglect of this issue in contemporary criticism. Offers a brief, lively, and accessible account of a new direction for critical practice, from one of Britain's most prominent literary theorists and critics. Proposes a new path for future criticism, more open to reflecting on the pleasures of fiction. Written in a clear, jargon-free style, and illustrated throughout with numerous examples.

Design a plan for communication and professional development. Build assistants' skills in school management, instructional leadership, and personnel management.

A New York Times bestseller: "A passionate and convincing case for the sophistication of nonhuman minds." —Alison Gopnik, *The Atlantic* Hailed as a classic, *Are We Smart Enough to Know How Smart Animals Are?* explores the oddities and complexities of animal cognition—in crows, dolphins, parrots, sheep, wasps, bats, chimpanzees, and bonobos—to reveal how smart animals really are, and how we've underestimated their abilities for too long. Did you know that octopuses use coconut shells as tools, that elephants classify humans by gender and language, and that there is a young male chimpanzee at Kyoto University whose flash memory puts that of humans to shame? Fascinating, entertaining, and deeply informed, de Waal's landmark work will convince you to rethink everything you thought you knew about animal—and human—intelligence.
